

Guadalupe Regional Medical Center Celebrates 1,000 Robotic Surgeries

Guadalupe Regional Medical Center (GRMC) has reached a significant milestone accomplishment, completing 1,000 robotic surgeries. Since 2014, GRMC has offered general and gynecological robotic surgery, allowing physicians an amazing degree of accuracy and control, while providing patients a less invasive surgical option and quicker recovery time.

"Our goal when investing into a robotic surgical system was for our patients to feel more comfortable being able to stay closer to home when in need of complex surgical procedures. I am very pleased to have accomplished 1,000 robotic surgeries at GRMC. Our surgeons and staff continue striving to be leaders in this ever-advancing technology-driven field", said Robert Haynes, CEO of Guadalupe Regional Medical Center.

Robotic surgery allows physicians to perform minimally invasive procedures with the assistance of robotic arms, giving better accuracy, flexibility, and control. This method of surgery is much less invasive, reducing a patient's hospital stay and allowing for a faster healing process. In addition, robotic procedures involve less risk of bleeding and infection, as well as minimal scarring.
